

## Worksheet: If IEEE 754 had a 12-bit standard ...

A model floating point system  $\mathbb{F}$  is in Lecture 13 of the textbook (L. Trefethen and D. Bau, *Numerical Linear Algebra*, SIAM Press 1997). Practical systems are implemented in bits and in hardware. The actual IEEE 754 standards for 32-bit single precision and 64-bit double precision representations are cumbersome, so for convenience we pretend here that the standard has a 12-bit version. It might look like this:

$s$	$e_1$	$e_2$	$e_3$	$e_4$	$b_1$	$b_2$	$b_3$	$b_4$	$b_5$	$b_6$	$b_7$
-----	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------

These 12 bits are organized as follows to represent a *nonzero* number:

$$x = (-1)^s (1.b_1b_2b_3b_4b_5b_6b_7)_2 2^{(e_1e_2e_3e_4)_2 - (0111)_2}$$

Note that  $(1.b_1b_2b_3b_4b_5b_6b_7)_2$  is called the *mantissa*. The power on the 2 is the *exponent*. The special offset  $(0111)_2$ , equal to 7 in base ten, is called the *exponent bias*. We also define some exceptional cases:

- exponent bits  $(0000)_2$  are used for the number zero or subnormal numbers
- exponent bits  $(1111)_2$  are used for the other exceptions:  $\pm\infty$  and NaN

(No further details of the  $(1111)_2$  exceptions will be considered here.) *Normal* numbers have exponents in this range:  $1_{10} = (0001)_2 \leq (e_1e_2e_3e_4)_2 \leq (1110)_2 = 6_{10}$ .

(a) What is the largest real number that this system can represent? Show the bits.

--	--	--	--	--	--	--	--	--	--	--	--

(b) What is the smallest positive number that this system can represent? (*I.e. what is the first normal number to the right of zero?*) Show the bits.

--	--	--	--	--	--	--	--	--	--	--	--

(c) If we define  $\epsilon_{\text{machine}}$  as the gap between 1 and the next representable number greater than 1, what is the value of  $\epsilon_{\text{machine}}$  in this system?

(d) What is the representation of zero? Show the bits.

[illegible]

(e) What is the representation of 4? Show the bits.

[illegible]

(f) What is the largest representable number which is smaller than 8? Show the bits.

[illegible]

(g) In the interval  $[4, 8)$ , how many numbers can be represented?

**(h)** Including zero, exactly how many distinct normal numbers can be represented in this system? (Exclude subnormal numbers, and exclude exceptions using exponent  $(1111)_2$ , e.g.  $\pm\infty$  and NaN.)

(i) Show the bits of one subnormal number.

[illegible]
